# **2.7 Moment Generating Functions**

## Summary

Table 2.1

Discrete probability distribution	Probability mass function, $p(x)$	Moment generating function, $\phi(t)$	Mean	Variance
Binomial with parameters $n, p$ , $0 \le p \le 1$	$\binom{n}{x}p^{x}(1-p)^{n-x},$ $x = 0, 1, \dots, n$	$(pe^t + (1-p))^n$	пр	np(1-p)
Poisson with parameter $\lambda > 0$	$e^{-\lambda} \frac{\lambda^x}{x!},$ $x = 0, 1, 2, \dots$	$\exp\{\lambda(e^t-1)\}$	λ	λ
Geometric with parameter $0 \le p \le 1$	$p(1-p)^{x-1},$ $x = 1, 2, \dots$	$\frac{pe^t}{1-(1-p)e^t}$	$\frac{1}{p}$	$\frac{1-p}{p^2}$

Table 2.2

Continuous probability distribution	Probability density function, $f(x)$	Moment generating function, $\phi(t)$	Mean	Variance	
Uniform over (a, b)	$f(x) = \begin{cases} \frac{1}{b-a}, & a < x < b \\ 0, & \text{otherwise} \end{cases}$	$\frac{e^{tb} - e^{ta}}{t(b-a)}$	$\frac{a+b}{2}$	$\frac{(b-a)^2}{12}$	
Exponential with parameter $\lambda > 0$	$f(x) = \begin{cases} \lambda e^{-\lambda x}, & x > 0 \\ 0, & x < 0 \end{cases}$	$rac{\lambda}{\lambda-t}$	$\frac{1}{\lambda}$	$\frac{1}{\lambda^2}$	
Gamma with parameters $(n, \lambda), \lambda > 0$	$f(x) = \begin{cases} \frac{\lambda e^{-\lambda x} (\lambda x)^{n-1}}{(n-1)!}, & x \ge 0\\ 0, & x < 0 \end{cases}$	$\left(\frac{\lambda}{\lambda-t}\right)^n$	$rac{n}{\lambda}$	$\frac{n}{\lambda^2}$	
Normal with parameters $(\mu, \sigma^2)$	$f(x) = \frac{1}{\sqrt{2\pi}\sigma}$ $\times \exp\{-(x-\mu)^2/2\sigma^2\},$	$\exp\left\{\mu t + \frac{\sigma^2 t^2}{2}\right\}$	$\mu$	$\sigma^2$	
	$-\infty < x < \infty$				

#### 2.8 Limit Theorems

**Proposition 1.** Let X be a non-negative random variable, then for any value a > 0,

$$P[X \ge a] \le E[Y]$$

It is called a Markov's Inequality

Proof. 
$$E[X] = \int_{0}^{\infty} x \cdot f(x) dx = \int_{0}^{\infty} x \cdot f(x) dx + \int_{0}^{\infty} x \cdot f(x) dx + \int_{0}^{\infty} x \cdot f(x) dx = \int_{0}^{\infty} f(x)$$

**Proposition 2.** If X is a random variable with mean  $\mu$  and variance  $\sigma^2$ , then, for any value k > 0,

$$P[|x-\mu| \ge k] \le \frac{0^2}{k^2}$$

It is called Chebyshev's Inequality.

Proof.  $(x-u)^2$ : non regative v.v. so applying the Morkou's inequality.

P( $(x-u)^2$  >  $(x^2)^2$   $(x^2)^2$   $(x^2)^2$   $(x^2)^2$   $(x^2)^2$ 

These inequalities help us to obtain bounds for the probabilities, without knowing the actual probability density function - only the mean and variance need to be known.

**Example 3.** Suppose we know that the number of items produced in a factory during a week is a random variable with a mean of 500.

1. What can be said about the probability that this week's production will be at least 1000?

$$P(X \gg 1000) \leq \frac{E(+)}{1000} = \frac{500}{1000} = \frac{1}{2}$$

2. If the variance of a week's production is known to equal 100, then what can be said about the probability that this week's production will be between 400 and 600?

$$P[|\chi - 5\infty| > 100] \leq \frac{\sigma^2}{(100)^2} = \frac{100}{(00)^2} = \frac{1}{100}$$

$$\frac{1}{100} = \frac{100}{100} = \frac{100}{100} = \frac{100}{100} = \frac{100}{100}$$

**Theorem 4** (Strong Law of Large Numbers). Let  $X_1, X_2, ...$  be a sequence of independent random variables having a common distribution, and let  $E[X_i] = \mu$ . Then with probability 1,

$$\frac{X_1 + X_2 + \dots + X_n}{n} \to \mu \quad as \ n \to \infty$$

**Example 5.** Let  $X_1, X_2, ...$  be a sequence of independent binomial random variables with parameters n and p. Given that  $E[X_i] = np$  for all i, we have by the strong law of large numbers that, with probability 1,

$$\frac{X_1 + X_2 + \dots + X_m}{m} \to np \text{ as } m \to \infty$$

**Theorem 6** (Central Limit Theorem: Linderberg). Let  $X_1, X_2, ...$  be a sequence of independent, (not necessarily) identically distributed random variables. Let  $E[X_i] = \mu_i$ ,  $Var(X_i) = \sigma_i^2$ . Let

$$S_n = \frac{X_1 + X_2 + \dots + X_n - \sum_i \mu_i}{\sqrt{\sum_i \sigma_i^2}}$$

then the probability function  $S_n$  converges to a standard normal distribution N(0,1) as  $n \to \infty$ .

**Theorem 7** (Central Limit Theorem: Special Case). Let  $X_1, X_2, ...$  be a sequence of independent, identically distributed (iid) random variables, each with mean  $\alpha$  and variance  $\alpha^2$ . Then the distribution of

$$\frac{X_1 + X_2 + \dots + X_n - n\mu}{\sigma\sqrt{n}}$$

tends to the standard normal as  $n \to \infty$ . That is,

$$P\left\{\frac{X_1 + X_2 + \dots + X_n - n\mu}{\sigma\sqrt{n}} \le a\right\} \to \frac{1}{\sqrt{2\pi}} \int_{-\infty}^a e^{-x^2/2} dx \text{ as } n \to \infty$$

**Example 8.** Let X be a binomial random variable with parameters n and p. Then  $X = X_1 + \cdots + X_n$  where  $X_i$  is a Bernoulli random variable with a parameter p.

1. Find  $E[X_i]$ 

2. Find  $Var(X_i)$ .

3. As  $n \to \infty$ , does *X* follow N(0,1)? Why?

$$\frac{X_1 + X_2 + \cdots + X_N - NM}{\sigma \cdot ln} = \left(\frac{X - Np}{lnpq}\right) \sim Normel(3,1)$$

$$\sigma \cdot ln$$

$$\sigma \cdot ln$$

$$\sigma \cdot ln$$

**Example 9.** Let X be the number of times that a fair coin, flipped 40 times, lands heads. Find the probability that X = 20 Use the normal approximation and then compare it to the exact solution. In addition, find P[X > 25].

$$\begin{array}{lll}
\text{The exact solution. In addition, into } P[X > 25]. \\
P\{19.5 \le X \le 20.5\} &= P(\frac{19.5 - 20}{10} < \frac{X - 20}{10} < \frac{20.3 - 20}{10}) \\
&= P\{-.16 < 8 < .16\} = .0272
\\
P(X > 25] &= P(X > 26] = .P(X > 25.5)
\\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&= P(X > 25.5) = P(X > 25.5) \\
&=$$

**Example 10.** From an urn containing 10 identical balls numbered 0 to 9, n balls are drawn with replacement. Use the Central Limit Theorem to find the probability that among n numbers chosen, the numbers 5 will appear between  $\frac{n-3\sqrt{n}}{10}$  and  $\frac{n+3\sqrt{n}}{10}$  times, if (i) n=25 (ii) n=100

$$n = 25, (ii) n = 100.$$

$$\chi_{i} = \begin{cases} 1 & \text{if 5 appears on the ith draw} \\ 0 & \text{o.w.} \end{cases}$$

$$|P| = \frac{n-3\ln}{10} \leq \sum_{i} \sum_{j} \left( \frac{n+3\ln}{10} \right)^{j}$$

$$= \int_{0}^{2} \frac{n-3\sqrt{n}}{10} - \Sigma \mu_{i}$$

$$\leq \int_{0}^{2} \frac{\Sigma \chi_{i}^{2} - \Sigma \mu_{i}}{\left(\sum \sigma_{i}^{2}\right)} \leq \frac{n-3\sqrt{n}}{\left(\sum \sigma_{i}^{2}\right)} \leq \frac{n-3\sqrt{n}}{\left(\sum \sigma_{i}^{2}\right)}$$

$$Q_{1}^{i} = E(x_{5}) - (E(x_{2}))_{5} = \frac{1}{10} - (\frac{10}{10})_{5} = \frac{100}{10} - \frac{100}{10} = \frac{100}{10}$$

$$W_{1} = E(x_{5}) = 0 \cdot b(x_{5} = 0) + 1 \cdot b(x_{2} = 1) = \frac{100}{10} - \frac{100}{10} = \frac{100}{10}$$

### 2.9 Stochastic Processes

What is a Stochastic Process

• A stochastic process is a collection of random variables (RVs), usually denoted by

$$X = \{X(t) : t \in T\}$$

- *t* is a call index, most commonly it denotes times.
- *T* is called the index set.
- *X*(*t*) is a random variable (RV) associated with an index *t*. We say *X*(*t*) is the state of the system at time *t*.
- If X(t) takes values in a set S for every  $t \in T$ , then S is called the sample space of X.
- For example, X(t) may represent the total number of customers that have entered a supermarket by time t; or the number of the customers in the super market at time t; or the total amount of sales that have been recorded in the market by time t, etc.

Thus, a stochastic process is a family of random variables that describes the evolution through time of some (physical) processes.

## Chapter 3. Conditional Probability and Conditional Expectations

### 3.1 Introduction

- i. We are often interested in calculating probabilities and expectations when some partial information is available. ✓
- ii. In calculating a desired probability or expectation it is often extremely useful to first condition on some appropriate random variables.

### 3.2 The Discrete Case

Conditional probability mass function:

P[X = x|Y = y] = 
$$P_{X|Y}(X|Y) = \frac{P(X=X, Y=Y)}{P_{Y}(Y)}$$

Conditional expectation:

$$E[X|Y=y] = \sum_{X} x p(X=X)$$

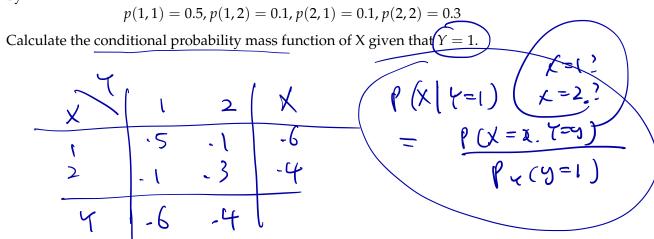

### Example 11.

y x	0	1	2	Marginal $p_X(x)$
1	1/16	3/16	1/16	5/16
2	2/16	3/16 1/16	0	3/16
3	5/16	1/16	2/16	8/16
Marginal $p_Y(y)$	8/16	5/16	3/16	1

Find 
$$E[X|Y=0]$$
  $\sum X \left( \frac{1}{2} \left( \frac{1}{2} \right) \right)$ 

$$= \left( \frac{1}{2} \left( \frac{1}{2} \right) \left( \frac{1}{2} \right) + \frac{1}{2} \cdot \frac{1}{2} \frac{1}{2} \cdot$$

**Example 12.** Suppose that p(x, y), the joint probability mass function of X and Y, is given by

**Example 13.** If X and Y are independent Poisson random variables with means  $\lambda_1, \lambda_2$ , respectively, calculate the conditional expected value of X given that X + Y = n.

respectively, calculate the conditional expected value of 
$$x$$
 given that  $x + y = n$ .

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|Cx = k \mid x + y = n|$$

$$|C$$

### 3.3 The Continuous Case

Conditional probability density function:

$$f_{X|Y}(x|y) = \frac{f_{X|Y}(x|y)}{f_{X|Y}(x|y)}$$

Conditional expectation:

$$E[X|Y=y] = \int \chi \, C_{X}(Y) \, dX$$

Example 14. Given
$$f_{X,Y}(x,y) = \begin{cases} x^2 + xy/3, & 0 < x < 1, 0 < y < 2 \\ 0, & \text{elsewhere} \end{cases}$$
Find  $E[X|Y = y]$ .
$$\int_{\delta}^{1} x f_{X|Y}(CX|Y) dt = \begin{bmatrix} \frac{1}{3}x^3 + \frac{x^2}{6}y \end{bmatrix}_{\delta}^{1} = \frac{1}{3} + \frac{y}{6} = \frac{2+y}{6}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{2} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{2} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{2} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{2} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{2} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{2} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{2+y}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$f_{X|Y}(x,y) = \frac{6x^2 + 2xy}{3} = \frac{6x^2 + 2xy}{3}$$

$$= \frac{3}{2(2+3)} + \frac{23}{(2-3)3} + \frac{9+43}{(2-3)}$$

## Example 15. Given

$$f_{X,Y}(x,y) = \begin{cases} \frac{1}{2}ye^{-xy}, & 0 < x < \infty, \ 0 < y < 2 \\ 0, \text{ elsewhere} \end{cases}$$
Find  $E[e^{X/2}|Y=1]$ .
$$f_{X,Y}(x,y) = \begin{cases} \frac{1}{2}ye^{-xy}, & 0 < x < \infty, \ 0 < y < 2 \\ 0, \text{ elsewhere} \end{cases}$$

$$f_{X,Y}(x,y) = \begin{cases} \frac{1}{2}ye^{-xy}, & 0 < x < \infty, \ 0 < y < 2 \\ 0, \text{ elsewhere} \end{cases}$$

$$f_{X,Y}(x,y) = \begin{cases} \frac{1}{2}ye^{-xy}, & 0 < x < \infty, \ 0 < y < 2 \\ 0, \text{ elsewhere} \end{cases}$$
